TURQUOISE™ STONE

The most unusual and rare building and landscape stone to be introduced in recent years has excited and stirred the imagination of those involved in building commercial and residential structures, landscape construction and other forms of decorative art.

TURQUOISE STONE is a very hard natural quartzite material, deriving its blue-green color from the mineral chromium, which permeated the sands of ancient Lake Bonneville more than 500 million years ago. Located in Park Valley, Utah at the base of the Raft River range of mountains, the ROCKY MOUNTAIN QUARTZITE TURQUOISE STONE quarry is the only known commercial deposit of its kind in the world.

Our quarry produces building, landscape and specialty stone products, having qualities generally recognized as unequalled when compared to other natural stone products, even those similar in composition or adaptability.

TURQUOISE STONE, the color wonder of the stone world, is completely resistant to the most severe conditions of climate and air pollution, its spectacular color is guaranteed against fading - *Forever*. Simply install and forget all your expensive maintenance problems so common to other materials. *Equally* popular with the do-it-yourself advocate desiring to extend his personality into a fine home or landscape, or the mason expressing his artistry in the finest building material available to man - NATURAL STONE.
