## Typical Paver Installation\*

1. Excavate unsuitable, unstable or unconsolidated subgrade material and compact the area which has been cleared. Backfill and level with dense graded aggregate suitable for base material (typically 3" - 6" for pedestrian/light vehicular traffic and 8" - 10" for driveway applications), or as otherwise directed by site engineer/architect/landscape architect.
2. Install edge restraint using concrete curb, concrete toe or edging.
3. Place bedding course of sharp, normal-weight screening or concrete sand to a uniform depth of approximately 1" leveled to grade.
4. Install Basalite Pavers hand tight with joints approximately 1/8". Where required, cut stones with an approved cutter to fit accurately.
5. Tamp pavers with mechanical vibrator, uniformly level true to grade and free of movement.
6. Fill voids in joints by sweeping dry, fine, sharp sand over pavers.

\*The installation instructions and illustrations shown are a basic overview of paver installation methods. Because of the variety of applications, please refer to the Standard ICPI installation method or visit [www.ICPI.org](http://www.ICPI.org).

NOTE: Printed colors shown in this brochure may vary from actual product colors. We recommend color selection be made from actual product samples.

Custom colors are available by special order - please contact your local dealer.
